

PRINTGUIDE SIGNWORKS 2025-02-12

Welcome to Signworks Stockholm AB.

Signworks is a large-format printing company in Bromma, a stone's throw from Bromma airport and Stockholm city. Through digital printing, we create, process and assemble signs, decals, banners and exposure materials.

We print, cut, mill, fold, sew and laser cut most materials such as paper, cardboard, vinyl, fabric, plastic, aluminum, iron, wood, etc.

Only the imagination is the limit!

We print digitally with Greenguard certified UV ink with color resolution CMYK + vi. UV ink produces a satin finish if you want a glossy finish we could put a gloss laminate on most materials.

Below follows recommendations for delivery of originals for printing so production and delivery will go smoothly and you as a customer should be satisfied with the end result.

Recommended file formats: PDF, AI, EPS alt. TIFF

Fonts and images: Vectorized and embedded

Color profile/ICC: Fogra 39

File transfer via email, spreid or via dropbox link. Sent to: order@signworks.se

Cut marks and all should be a maximum of 5 -10 mm.

Scale: 1:1 or in 10% size (then specify it in the original name).

Recommended resolution should normally be 150-300 dpi in the slow format, depending viewing distance. If the picture is to be seen up close, the original must have a higher resolution and at a long distance it is not as important. Some guidelines according to the image below:

Betraktningssavstånd (meter)	Minsta textstorlek (punkt)*	Minsta upplösning (dpi)
0,5	5	300
1	8	180
1,5	13	120
2	16	100
3	25	70
5	41	60
10	82	50
15	125	40
50	410	30
60	500	25

* 1 punkt = 0,376 mm

Our machines are calibrated by professionals. But different printing methods, machines, color solutions and inks give different results. Material that you want to print on affects the final result. The color and opacity of the material produce different results. In case of doubt or if it is extra important if a certain color comes out perfectly, then we can make a sample print.

We recommend that texts and logos are vectorized so that they can be enlarged without losing sharpness. If you want cut outs the files must be vectorized so that it is possible to insert cutting paths.

The cutting paths should preferably be prepared in print originals with a magenta color and referred to as a spot color (decorative color) in a separate layer.

For wall foiling of larger pieces (about 3x10m) it is recommended to use approx. 20-40mm extra all around (without cut marks).

If necessary, we are happy to help with design and originals.
